## **ACKNOWLEDGEMENTS**

We would like to express our sincere gratitude to all those who supported and accompanied us during our studies and the implementation of this graduation project.

First of all, we sincerely thank **MSc. Do Cong Duc**, our project supervisor, for his dedicated guidance, valuable feedback, and continuous support throughout the development of our project titled “Build an e-commerce application that integrates AI”. His mentorship played a crucial role in helping us complete this project successfully.

We also extend our thanks to all lecturers at the Vietnam – Korea University of Information and Communication Technology, The University of Danang (VKU) for providing us with the foundational knowledge and professional skills that enabled us to carry out this project confidently.

We are grateful to our classmates and team members for their cooperation and support throughout the working process.

Lastly, we would like to thank our families for always being a strong source of motivation and encouragement during our studies and project work.

Although we have made great efforts, due to limited experience and time, this report may still contain shortcomings. We sincerely welcome any feedback from our instructors to help us improve in the future.

We are truly grateful.

## **STATEMENT OF AUTHORSHIP**

We hereby declare that this graduation project report, titled “Build an e-commerce application that integrates AI”, is the result of our own work. It has not been copied or plagiarized from other sources. All references and sources of information used in the project have been properly cited and acknowledged.

We confirm that this report has not been submitted, in whole or in part, for any other degree or qualification at this or any other institution.

We take full responsibility for the content of this report.

# INTRODUCTION

## 1. Problem statement

In recent years, e-commerce has witnessed remarkable growth both globally and in Vietnam. However, many small and medium-sized enterprises (SMEs) still face challenges in adopting cost-effective and user-friendly digital commerce solutions. There is a growing demand for flexible, scalable, and accessible platforms that can help businesses expand their online presence efficiently.

In this context, building a cross-platform e-commerce application becomes highly relevant. Such an application can support businesses in managing their online stores, handling customer interactions, and streamlining product and order management in a convenient and scalable manner.

## 2. Aims and Objectives

The overall aim of this project is to develop a cross-platform e-commerce application to improve user experience and support business operations.

The specific objectives of this thesis are to:

- Develop a multi-platform mobile application using Flutter.
- Integrate Firebase as a robust backend for data management and user authentication.
- Build essential e-commerce functionalities, including product listing, shopping cart, user authentication, order tracking, and payment processing.
- Design a user-friendly interface to ensure smooth user interaction and usability.

## 3. Structure of the thesis

After the *Introduction*, the thesis is structured in three chapters:

*Chapter 1: Overview of E-commerce.* This chapter presents the fundamental concepts of e-commerce, analyzes popular e-commerce platforms in the Vietnamese market such as Shopee, Lazada, and Tiki, and identifies opportunities and limitations for new solutions.

*Chapter 2: System Analysis and Design.* This chapter includes requirement analysis, system architecture, database modeling using Firebase, and the design of user interfaces based on Material Design principles.

*Chapter 3: AI Integration and Smart Features.* This chapter proposes the implementation of AI-driven modules including product image generation using Stable Diffusion, smart product recommendation systems, chatbot integration, and optimization strategies.

Finally, there are *Conclusions*, *Suggestions*, *References* and *Appendices* related to the topic.

# CHAPTER 1. OVERVIEW OF E-COMMERCE

## 1.1 Overview Of E-Commerce

### 1.1.1 *Definition and Characteristics of E-commerce*

E-commerce, or electronic commerce, refers to the buying and selling of goods and services through electronic networks, primarily the Internet. Its key characteristics include digital transactions, automation of processes, global accessibility, and 24/7 availability.

There are several common types of e-commerce models:

- Business to Consumer (B2C): Businesses sell directly to individual customers (e.g., Shopee, Tiki).
- Business to Business (B2B): Transactions between companies, often involving wholesale or bulk orders.
- Consumer to Consumer (C2C): Individuals sell to each other through platforms like Facebook Marketplace or Cho Tot.

E-commerce has experienced significant global growth in recent years. In Vietnam, the market is expanding rapidly due to increasing internet penetration, mobile device usage, and improved logistics. The government's digital economy strategy further supports the development of online commerce.

### 1.1.2 *Popular E-commerce Platforms*

In recent years, various e-commerce platforms have rapidly evolved to dominate the digital marketplace in Southeast Asia, particularly in Vietnam. Among the most notable are Shopee, Lazada, and Tiki—each playing a crucial role in shaping the way consumers shop online and how sellers conduct business in the digital age.

#### Analysis of Leading Platforms

- Shopee

Shopee is one of the leading e-commerce platforms in Southeast Asia, known for its mobile-first approach, aggressive marketing strategies, and wide range of product categories. It features a user-friendly interface, frequent promotional campaigns (like Flash Sales and Free Shipping), and strong logistics support via Shopee Xpress. It also emphasizes social shopping by incorporating features like live streaming and in-app games.

- Lazada

Lazada, owned by Alibaba Group, leverages advanced logistics and backend technologies. Lazada stands out for its seller center tools, payment gateways, and integrations with global supply chains. The platform is designed to scale and accommodate both SMEs and large brands.

- Tiki

Tiki started as a book-selling platform and has expanded to become one of Vietnam's trusted e-commerce sites. It differentiates itself by focusing on genuine products, fast delivery (TikiNOW), and a more curated catalog. Tiki has a strong domestic user base and is known for customer service and reliable product quality.

### **Advantages and Limitations of Existing Platforms**

*Table 1.1 Strengths and Limitations of Shopee, Lazada, and Tiki*

| Platform | Strengths  | Limitations  |
|----------|--|--|
| Shopee   | Wide user base, attractive promotions, social features   | Fake products, intense competition, seller quality inconsistency |
| Lazada   | Advanced logistics, strong seller tools, Alibaba backing | Complicated seller onboarding, less user engagement              |
| Tiki     | High product quality, local trust, fast delivery         | Smaller product range, limited international expansion           |

## **1.2 Programming language**

### **1.2.1 Dart**

Dart is an object-oriented programming language developed by Google, optimized for building efficient and smooth user interfaces across multiple platforms. It is especially prominent when used with Flutter – a popular cross-platform UI toolkit. With its clear and concise syntax, Dart enables developers to quickly build and deploy applications on mobile, web, desktop, and even backend systems.

### Advantages of Dart:

- High performance: Dart compiles directly to native machine code, allowing apps to run quickly and smoothly on both Android and iOS.
- Hot reload: Enables real-time updates to the UI and application logic without restarting the app, significantly speeding up development and testing.
- Easy to learn and write: Dart's syntax is friendly and similar to Java or JavaScript, making it accessible for both beginners and experienced developers.
- Rich library ecosystem: Dart offers a wide range of built-in and third-party libraries, making it easy to implement common features like HTTP requests, JSON parsing, animations, and more.
- UI-focused design: Dart is designed with user interface development in mind, making it highly suitable for Flutter's reactive programming model and flexible UI architecture.

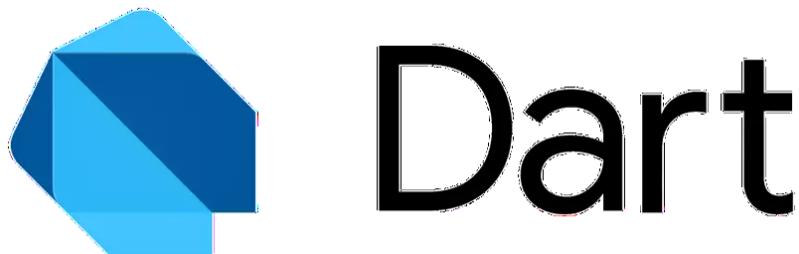

Figure 1.1 Dart

### 1.2.2 Python

Python is a high-level programming language known for its readable and easy-to-learn syntax, widely used in many fields such as web development, artificial intelligence (AI), machine learning, and data science. Python was developed in the late 1980s by Guido van Rossum, and first released in 1991. The goal of Python is to be an easy-to-understand, accessible language for programmers. Over the years, Python has become one of the most popular languages, with strong community support and integrated libraries for a variety of applications.

*Figure 1.2 Python*

Advantages and benefits:

- Simple, easy-to-read syntax: One of the reasons Python is loved is that its syntax is close to natural language, making it easy for programmers to write and understand source code. This reduces development time and makes code easier to maintain later.
- Versatile and flexible: Python can be used in a wide variety of domains. From web development with frameworks like Django and Flask, to data science, automation, machine learning, and artificial intelligence (AI) with libraries like TensorFlow, scikit-learn, pandas.
- Large community and documentation: Python has a huge community of programmers. This means there are a lot of learning materials, libraries, and frameworks, and online tutorials, help programmers easily solve problems encountered.
- Libraries and Frameworks: Python has a huge library ecosystem, especially in areas like data science, AI, and web development. Libraries like NumPy, pandas, and Matplotlib help with fast data processing and analysis, while frameworks like Django and Flask make web development a breeze.
- Suitable for small and large projects: Python can be used for everything from small, one-off projects to large, complex applications. Thanks to its clear syntax and good extensibility, Python is often chosen for both research, academic projects and large commercial products.
- Cross -platform: Python runs on almost every operating system, including Windows, macOS, and Linux, making it easy for developers to deploy applications across multiple platforms.

## 1.3 Framework

### 1.3.1 Flutter

Flutter is an open-source UI toolkit developed by Google, first introduced in 2017. It enables developers to build high-performance, cross-platform applications for mobile (Android and iOS), web, and desktop using a single codebase. With Flutter, developers write code in Dart—a modern, object-oriented programming language optimized for building user interfaces efficiently and expressively. One of Flutter's standout features is its "hot reload" capability, which allows developers to see changes in real time without restarting the app, significantly accelerating the development and testing process. Unlike other frameworks that rely on native UI components, Flutter uses its own high-performance rendering engine (Skia) to draw widgets directly to the screen. This gives developers full control over the UI and ensures consistent design and performance across all platforms. Flutter also offers a rich set of customizable widgets and tools, making it easy to create visually attractive, responsive, and smooth user experiences. Thanks to its flexibility, performance, and strong community support, Flutter has quickly become one of the most popular choices for cross-platform app development.

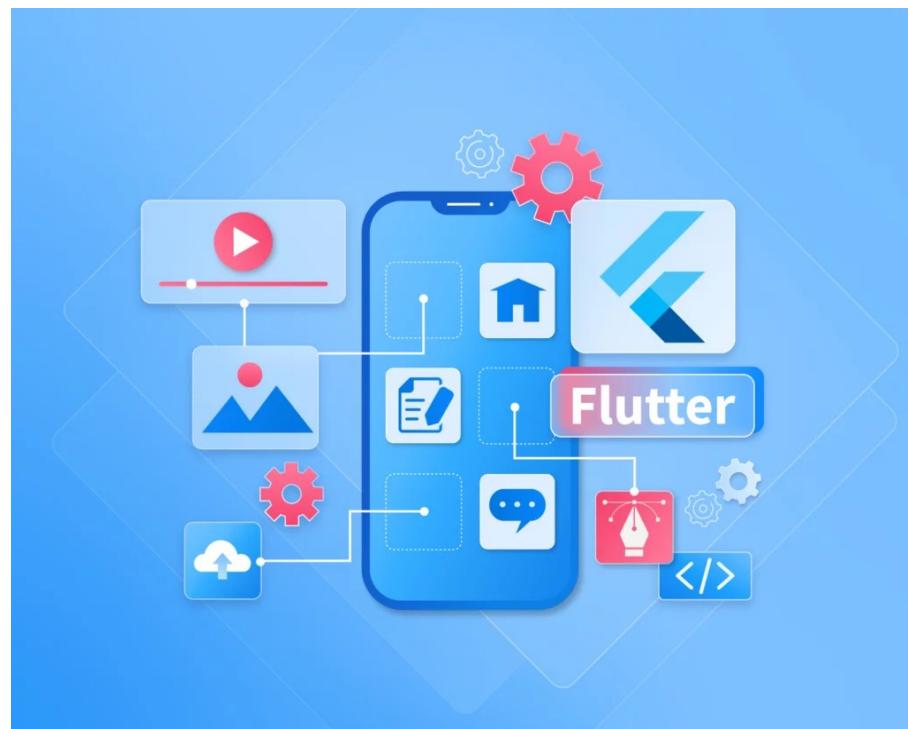

Figure 1.3 Flutter

### Advantages and benefits:

- Cross-platform development: Flutter allows developers to write a single codebase and deploy it across multiple platforms, including Android, iOS, web, Windows, macOS, and Linux. This significantly reduces development time and maintenance costs, especially for startups or teams with limited resources.
- High performance: Unlike many other cross-platform frameworks that rely on a bridge to communicate with native components, Flutter uses its own rendering engine (Skia) to draw everything directly to the screen. This results in smooth animations, fast load times, and a native-like performance on all platforms.
- Hot reload: This feature enables developers to instantly see the effects of code changes without restarting the entire application. It boosts productivity, allows for quick experimentation, easier debugging, and faster UI design iterations during development.
- Rich widget library: Flutter provides a comprehensive set of pre-designed and customizable widgets that follow both Material Design (Google) and Cupertino (Apple) guidelines. This makes it easy to build beautiful, responsive, and platform-adaptive user interfaces.
- Consistent UI and behavior: Since Flutter renders the UI itself and does not depend on native platform components, the look and feel of the app remain consistent across different operating systems. Developers don't have to worry about UI differences caused by OS version variations.
- Strong community and Google support: Flutter has robust backing from Google and a rapidly growing global community. This means frequent updates, strong documentation, and a large ecosystem of plugins, packages, and learning resources that help accelerate development.

## Comparison with React Native and Native Development

*Table 1.2 Comparison of Flutter, React Native, and Native Development*

| <b>Criteria</b>           | <b>Flutter</b>                               | <b>React Native</b>                    | <b>Native Development</b>                              |
|---------------------------|--|--|--|
| <b>Language</b>           | Dart   | JavaScript                             | Java/Kotlin (Android), Swift/Obj-C (iOS)               |
| <b>Rendering</b>          | Skia (custom UI engine)                      | Native components via JS bridge        | Native system APIs                                     |
| <b>Performance</b>        | Near-native (compiled to ARM code)           | Moderate (bridge causes some overhead) | Best (direct access to hardware)                       |
| <b>UI Consistency</b>     | High (custom-rendered)                       | Medium (depends on native components)  | High (native by default)                               |
| <b>Development Speed</b>  | Fast (hot reload, single codebase)           | Fast (but some bridging limitations)   | Slower (separate codebases for each platform)          |
| <b>Learning Curve</b>     | Medium (Dart-specific)                       | Low (JavaScript is widely known)       | High (platform-specific languages/tools)               |
| <b>Ecosystem Maturity</b> | Growing rapidly                              | Mature, widely adopted                 | Mature, platform-bound                                 |
| <b>Tooling</b>            | Official support via Android Studio, VS Code | Strong community tools                 | Robust, platform-specific IDEs (Xcode, Android Studio) |

### 1.3.2 FastAPI

FastAPI is a modern and fast web framework developed in Python, focused on building RESTful APIs. It was first released in 2018 by Sebastián Ramírez. FastAPI is notable for its ease of use, high performance, and strong support for Python type hints, which help reduce errors and improve development efficiency.

Some advantages and benefits of FastAPI framework:

- High Performance: FastAPI is built on Starlette and Pydantic, which makes it comparable in performance to frameworks like Node.js and Go.
- Integrated Type Hints: Use Python's type hints to reduce errors, automatically generate API documentation, and powerfully validate data.
- Automatic API documentation: FastAPI automatically generates OpenAPI and Swagger compatible API documentation, making API testing and development easier
- Easy to learn and easy to use: Clean syntax, easy to learn even for beginners, yet powerful enough for complex projects.
- Asynchronous support: FastAPI fully supports asynchronous features (async/await), helping to optimize performance for applications that require processing multiple tasks at the same time.

Figure 1.4 FastAPI

## 1.4 Platform

### 1.4.1 Firebase

Firebase is a comprehensive application development platform that provides developers and teams with a rich set of tools and services to build, improve, and scale

web and mobile applications efficiently. Originally launched in 2011 by James Tamplin and Andrew Lee, Firebase began as a real-time backend solution designed to synchronize data between users and applications in real-time. Since its acquisition by Google in 2014, Firebase has grown into a robust development suite integrated with the Google Cloud Platform

*Figure 1.5 Firebase*

**Firebase Services:** Authentication, Firestore, Storage, Functions  
Firebase offers a collection of core services that support backend development, enhance user engagement, and facilitate performance monitoring. The most widely used services include:

- **Firebase Authentication:** Simplifies user identity management by offering multiple login methods such as email/password, phone numbers, and federated identity providers like Google, Facebook, and Apple. It ensures secure authentication while providing ease of integration.
- **Cloud Firestore:** A flexible, scalable NoSQL cloud database that stores data in documents and collections. It supports powerful querying and real-time data synchronization across devices. Firestore is designed for offline support, enabling users to access content even without an internet connection.
- **Firebase Cloud Storage:** Ideal for storing user-generated content such as images, audio, and video. It is built on Google Cloud Storage and provides robust upload/download capabilities, secure access controls, and smooth integration with other Firebase services.

- Firebase Cloud Functions: A serverless backend solution that lets developers run backend code in response to events triggered by Firebase features or HTTPS requests. Cloud Functions automatically scale and eliminate the need for server management.

These services are modular and highly integrated, allowing developers to combine them to create scalable, full-featured applications.

#### Advantages of Firebase in Application Development:

Firebase provides several key benefits for building and maintaining modern applications:

- Real-time Updates: Firestore and Realtime Database allow instant data syncing, critical for apps like chat, collaborative editing, or e-commerce inventory.
- Cross-platform SDKs: Firebase supports Android, iOS, Flutter, and web, making it an excellent choice for cross-platform development.
- Security and Authentication: With Firebase Authentication and customizable security rules, developers can manage access and data protection easily.
- Scalability and Performance: Powered by Google Cloud, Firebase automatically handles traffic spikes and scales globally with minimal developer effort.
- Faster Development Cycles: Hot reload in Flutter, built-in services, and integration reduce development and testing time.
- Serverless Architecture: Cloud Functions allow code execution in response to database changes, authentication events, and API calls without provisioning servers.
- Built-in Analytics and Monitoring: Firebase integrates with Google Analytics, Crashlytics, and Performance Monitoring to provide deep insights into user behavior and app health.

#### 1.4.2 Postman

Postman is a powerful and widely-used API development platform that supports developers in designing, testing, documenting, and managing APIs efficiently. With its intuitive graphical interface, Postman allows users to easily send HTTP requests (such

as GET, POST, PUT, DELETE), observe server responses, and validate API functionality without writing manual code. It has become an essential tool in modern software development workflows, especially in projects that use microservices architecture or RESTful APIs.

# POSTMAN

*Figure 1.6 Postman*

Postman offers a wide range of key advantages, including:

- User-friendly and intuitive interface, making it accessible even to those with limited technical knowledge.
- Support for various HTTP methods and data formats, allowing accurate simulation of real-world API interactions.
- Collection management, enabling users to group requests logically by module or function, and easily share them with others.
- Environment variables, which allow seamless switching between different environments like development, staging, and production.
- Built-in automated testing, with JavaScript-based scripts that validate API responses and ensure stability over time.
- CI/CD integration via Newman, enabling automated API testing as part of the software deployment pipeline.
- Team collaboration, with Postman Workspaces allowing multiple team members to work together in real time.

- API monitoring, which periodically checks API health and helps detect issues proactively.

- Automatic API documentation, saving time and simplifying communication with frontend developers, testers, and third-party partners.

Thanks to these advantages, Postman is more than just an API testing tool—it is a vital part of a professional and scalable API lifecycle management system.

## CHAPTER 2. SYSTEM DESIGN ANALYSIS

### 2.1 System survey

#### 2.1.1 Field survey

For the e-commerce application development project, the current state survey reveals that Vietnam's market is experiencing rapid growth with major platforms like Shopee, Tiki, and Lazada dominating the market. However, significant gaps remain in niche segments, B2B e-commerce, or specialized industry sectors. Vietnam's technological infrastructure is well-prepared with a developed electronic payment system, increasingly sophisticated logistics services, and high smartphone penetration rates. Traditional business models of many enterprises have not yet fully undergoing digital transformation, creating substantial opportunities for new e-commerce solutions.

#### 2.1.2 User survey

Through surveying 500 potential customers, we identified that Vietnamese users prioritize fast and convenient shopping experiences with simple and user-friendly interfaces. They desire flexible payment methods, particularly cash-on-delivery and digital wallets. Personal information security and product reviews from other users are considered top priorities. For suppliers, they need simple management tools, bulk product upload support, and detailed revenue reporting. Administrators require comprehensive dashboards, real-time transaction monitoring capabilities, and powerful data analysis tools.

### 2.1.3 Business diagram

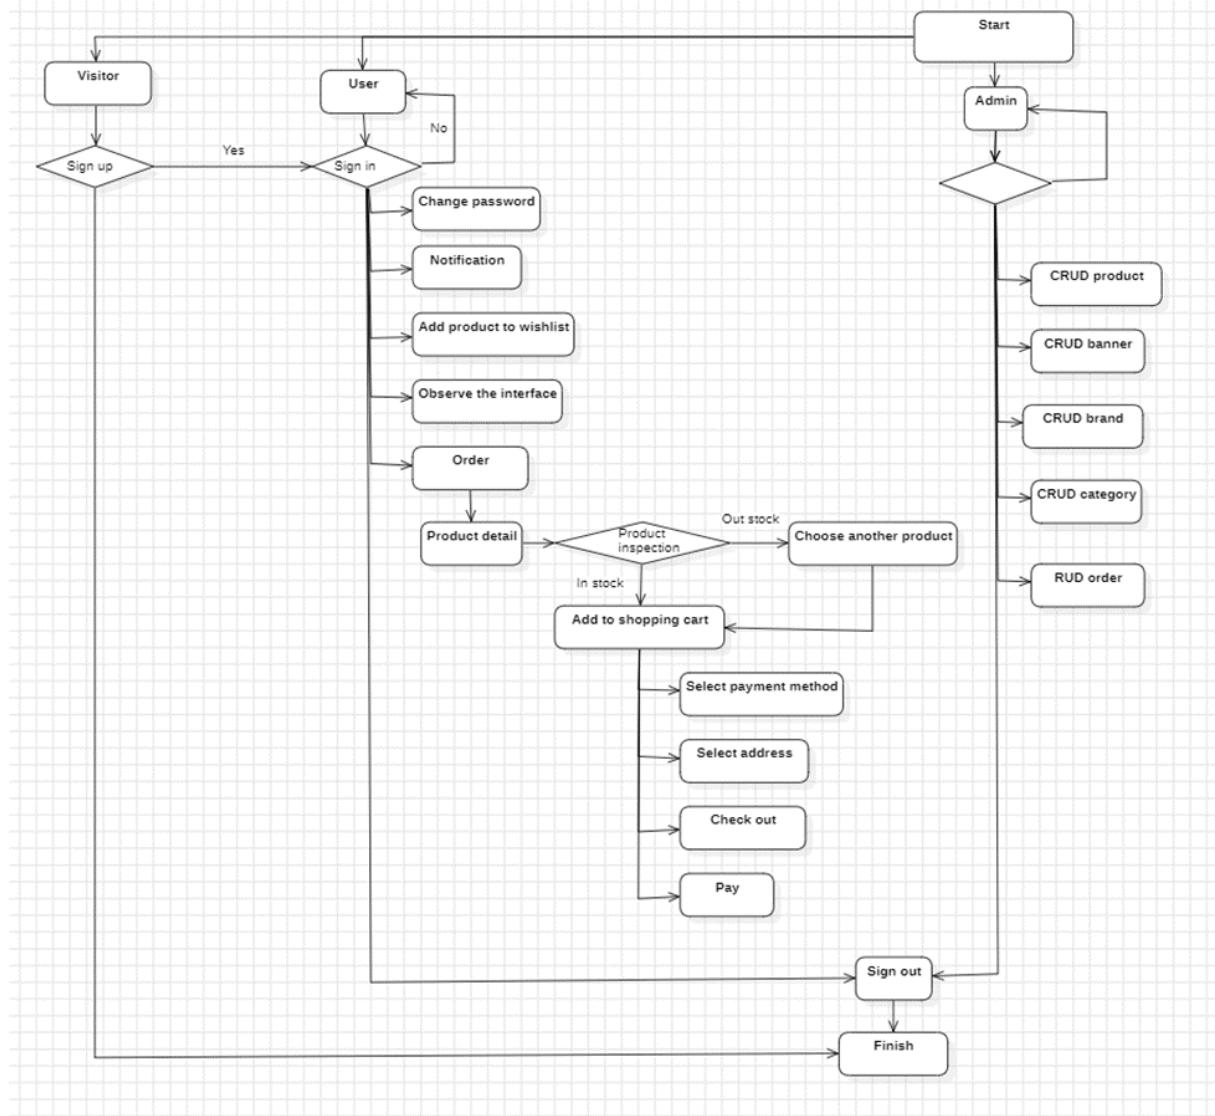

Figure 2.1 Business diagram

## 2.2 Software requirements specification

### 2.2.1 Identify the factors

The topic consists of three main factors

- User
- Admin

### 2.2.2 Functional requirements

#### \*.User

- Log in, log out, change password.
- Manage profile

- Manage address
- Manage product
- Manage wishlist product
- Managing product in the shopping cart
- Search
- View all product and brand
- View review and rating of product
- View order history and details
- Create, edit photos with AI

#### \*.Admin

- User management
- Manage media : CRD media
- Manage products : CRUD products
- Manage categories : CRUD categories
- Manage brands :`CRUD brands
- Manage banners : CRUD banners
- Manage order : RUD order
- Manage setting : CRU setting
- Manage profile : RU profile
- Data statistics
- Log in, log out, change password.

#### **2.2.3 Non - functional requirements**

- Interface, beautiful, simple, easy to use.
- Ensure security and safety.
- Fast processing speed.

## 2.3 Use Case Diagram

### 2.3.1 Overall

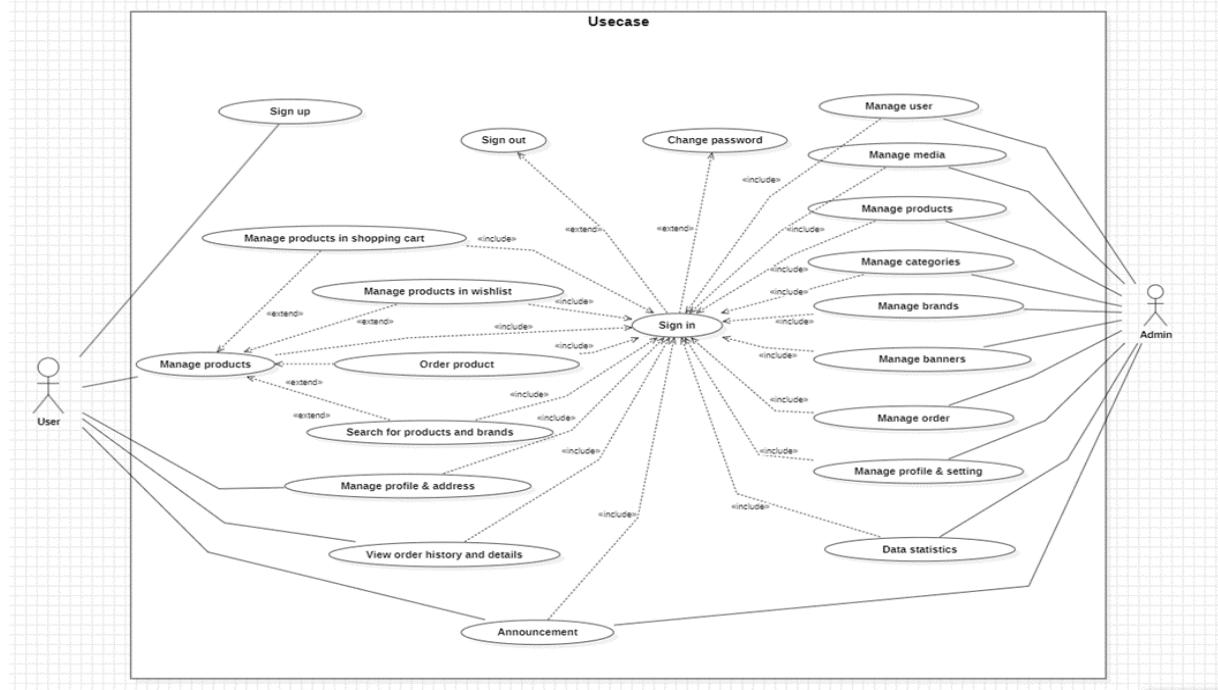

Figure 2.2 Overall use case

### 2.3.2 Managing product in the shopping cart

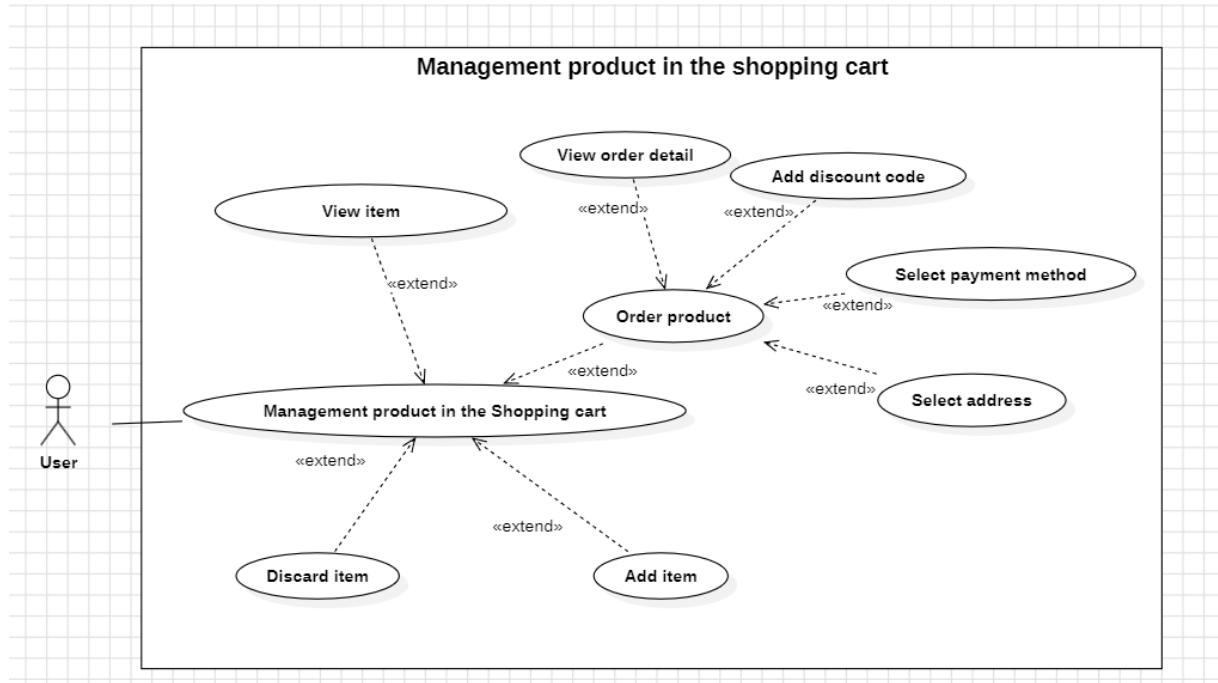

Figure 2.3 Managing product in the shopping cart

*Table 2.1 Scenario Use-case “Managing product in the shopping cart”*

| <b>Use case name</b>    | <b>Managing product in the shopping cart</b>   |
|-------------------------|--|
| <b>Description</b>      | Used to manage item-related activities such as collecting, viewing, using, crafting, upgrading, and disposing of items in the World.   |
| <b>Actors</b>           | User   |
| <b>Input</b>            | User has successfully logged in and enter shopping cart  |
| <b>Output</b>           | Successfully perform item management operations (View, add or delete items).   |
| <b>Basic flow</b>       | <ol style="list-style-type: none"> <li>1. The Actor clicks “Shopping cart” icon -&gt; The Use-case begins.</li> <li>2. The Actor can choose one of the following actions: <ul style="list-style-type: none"> <li>- View Item: Actor selects the “Inventory” icon. -&gt; Select an item to view details (stats, description).</li> <li>- Add items: Actor can add items =&gt; Items are added to inventory.</li> <li>- Discard item: Actor selects item from inventory and discards =&gt; Item is removed from inventory.</li> </ul> </li> <li>3. The Actor enter “Checkout” to order product: <ul style="list-style-type: none"> <li>- Select payment method: PayPal, Master card, Visa, Google Pay, ...</li> <li>- Select Address.</li> <li>- Check order detail and enter Checkout to pay.</li> </ul> </li> <li>4. The system saves the inventory updates -&gt; End of use case</li> </ol> |
| <b>Alternative flow</b> |  |
| <b>Exception flow</b>   | If the Actor attempts to pay but does not have enough funds:<br>The system will warn that this order cannot be executed.   |

### 2.3.3 Search

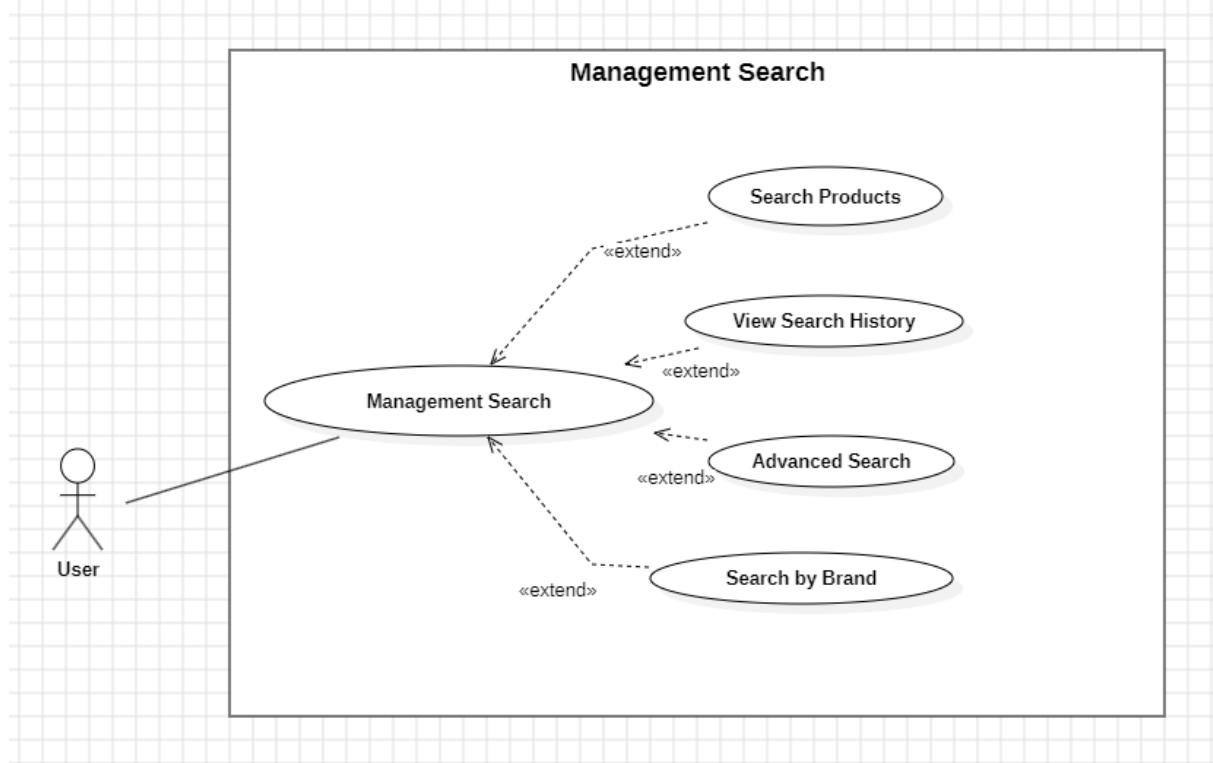

Figure 2.4 Use case search

Table 2.2 Scenario Use-case “Search”

|                         |  |
|-------------------------|--|
| <b>Use case name</b>    | Search   |
| <b>Description</b>      | Used to manage search.   |
| <b>Actors</b>           | User   |
| <b>Input</b>            | Actor successfully logged in   |
| <b>Output</b>           | Show list of product, brand  |
| <b>Basic flow</b>       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Search box” □ Start Use case</li> <li>2. Actor performs the necessary operations (view search history, search by product or brand) for the user.</li> <li>3. The system records and updates user edits if any. □ End of use case</li> </ol> |
| <b>Alternative flow</b> |  |
| <b>Exception flow</b>   |  |

### 2.3.4 User

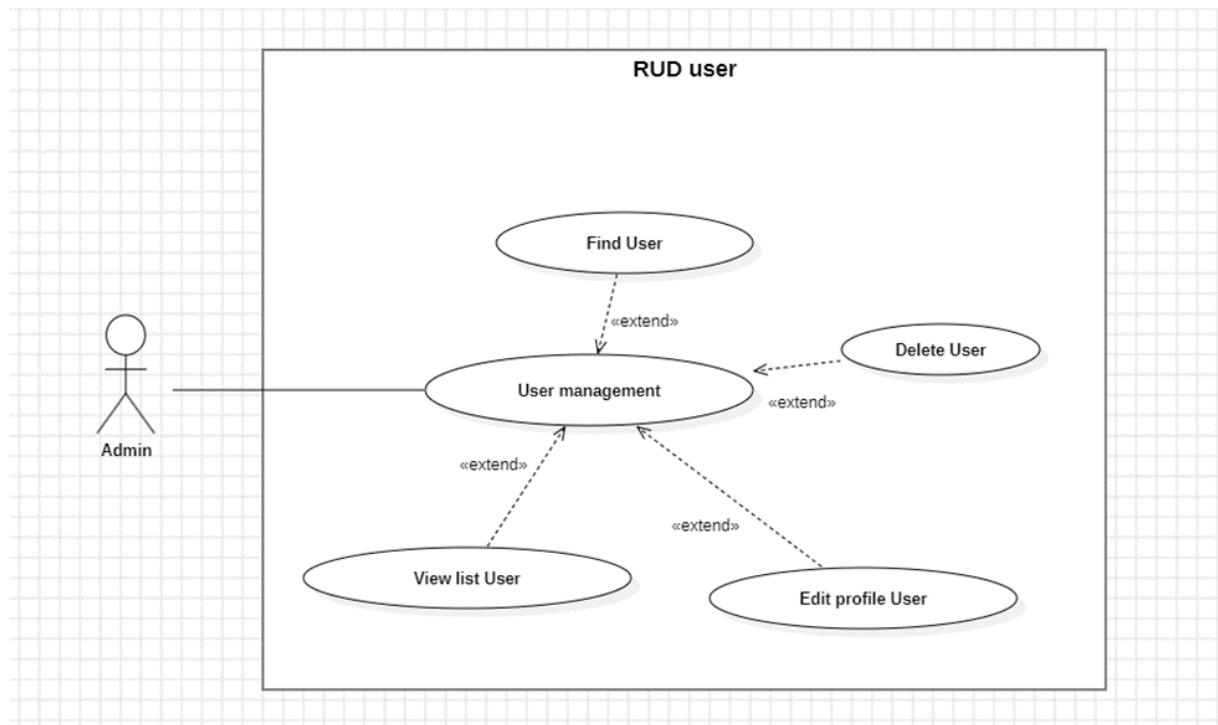

Figure 2.5 Use case User management

Table 2.3 Scenario Use-case “User”

|                         |   |
|-------------------------|---|
| <b>Use case name</b>    | <b>User Management</b>  |
| <b>Description</b>      | Used to manage users.   |
| <b>Actors</b>           | Admin   |
| <b>Input</b>            | Actor successfully logged in with admin rights  |
| <b>Output</b>           | Show list of users  |
| <b>Basic flow</b>       | <p>4. Actor clicks on the “Customer” menu in the side-bar -&gt; Start Use case</p> <p>5. Actor performs the necessary operations (view details, edit, delete, search) for the user.</p> <p>6. The system records and updates user edits if any. -&gt; End of use case</p> |
| <b>Alternative flow</b> |   |
| <b>Exception flow</b>   |   |

### 2.3.5 Address

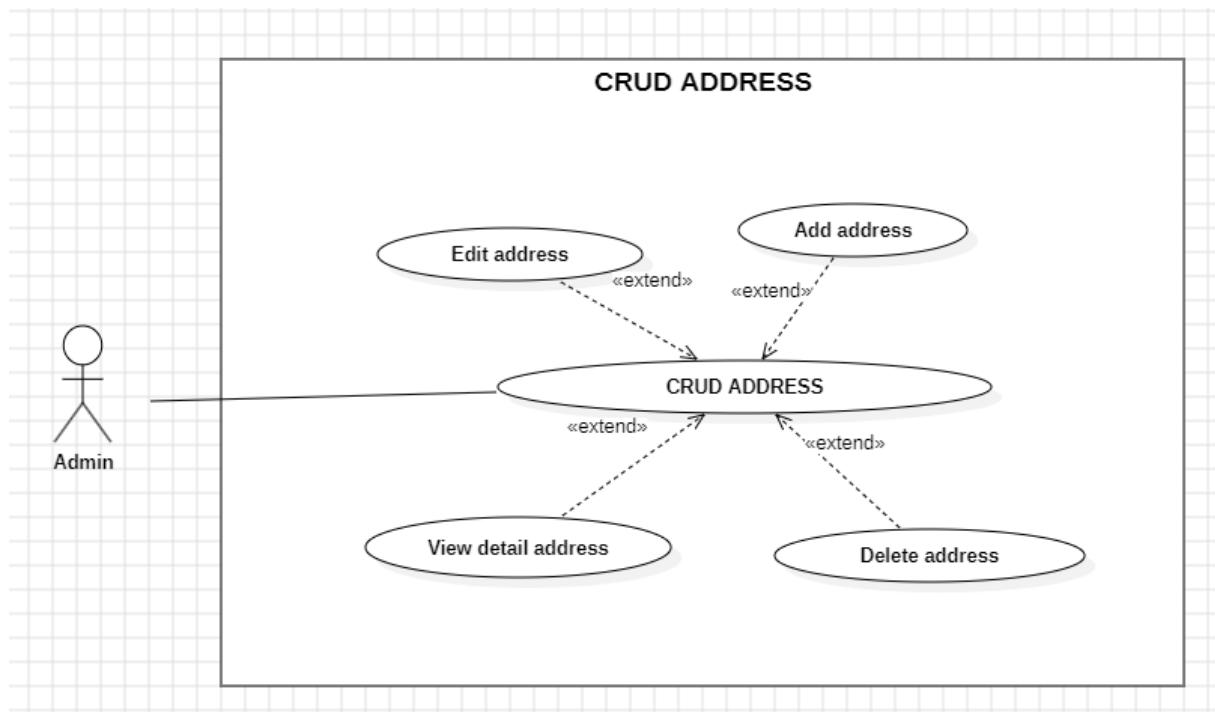

Figure 2.6 Use case address

Table 2.4 Scenario Use-case “Address”

|                         |   |
|-------------------------|---|
| <b>Use case name</b>    | Address Management  |
| <b>Description</b>      | Used to manage address.   |
| <b>Actors</b>           | User  |
| <b>Input</b>            | Actor successfully logged in  |
| <b>Output</b>           | Show list of address  |
| <b>Basic flow</b>       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “My address” menu in the profile -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, edit, delete) for the user.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| <b>Alternative flow</b> |   |
| <b>Exception flow</b>   |   |

### 2.3.6 Product

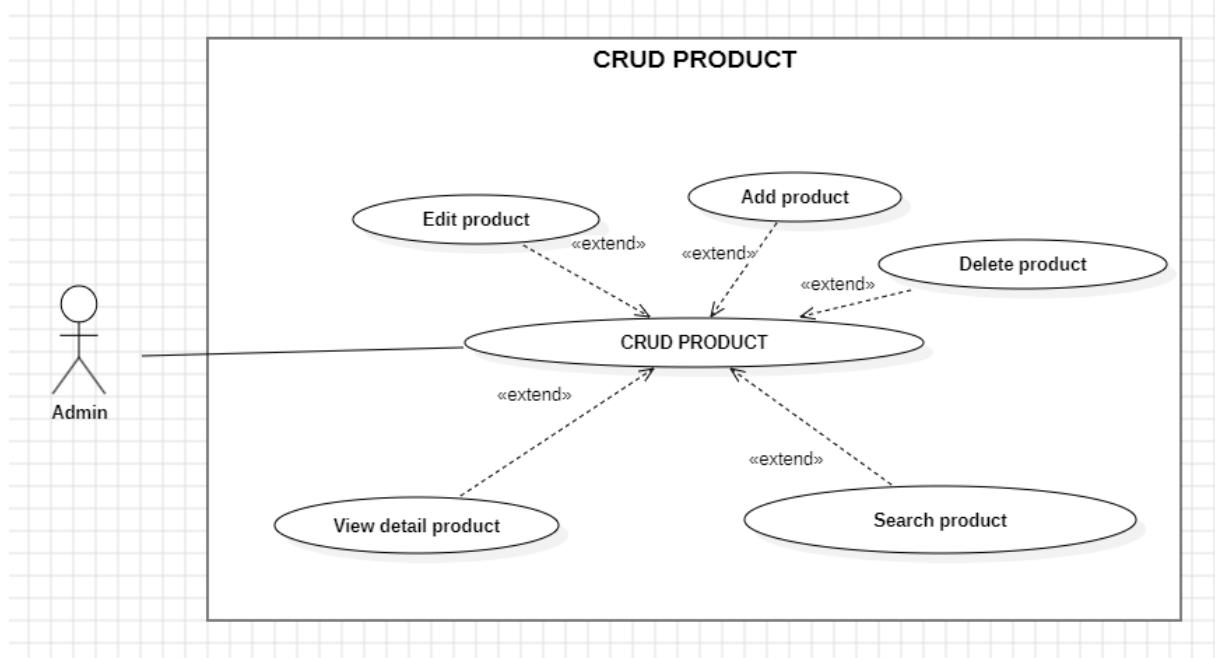

Figure 2.7 Use case product management

Table 2.5 Scenario Use-case “Product”

| Use case name    | Product  |
|------------------|--|
| Description      | Used to manage product   |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show list of product   |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Product” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, edit, delete, search) for the product.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.7 Banner

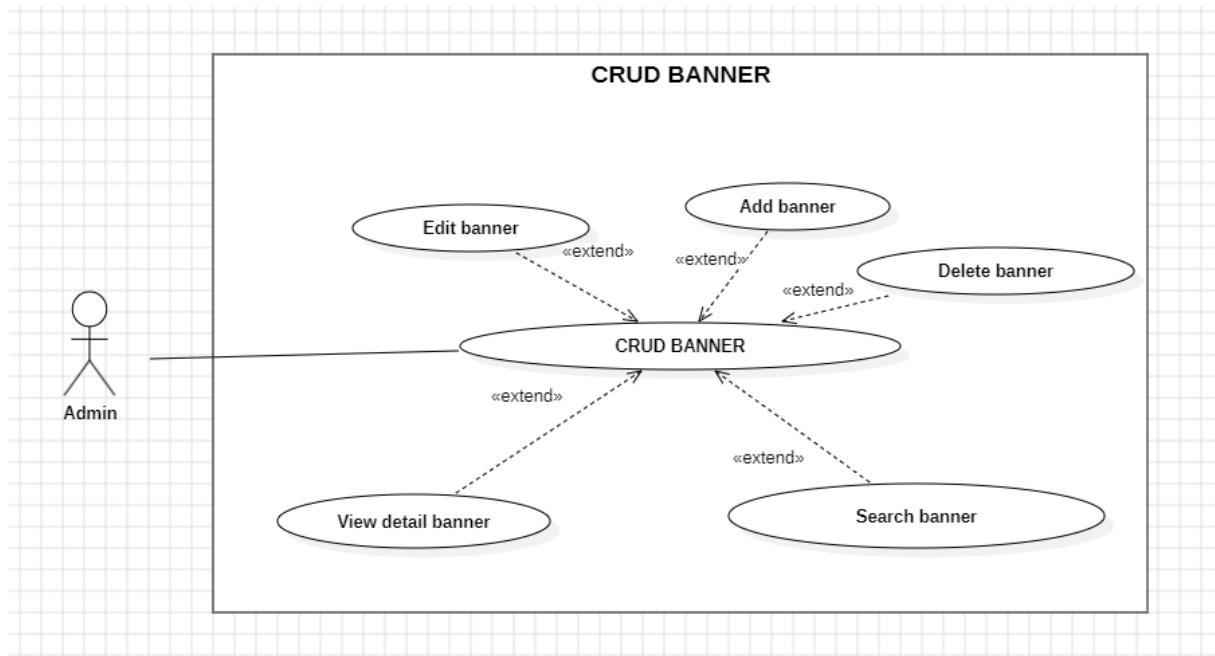

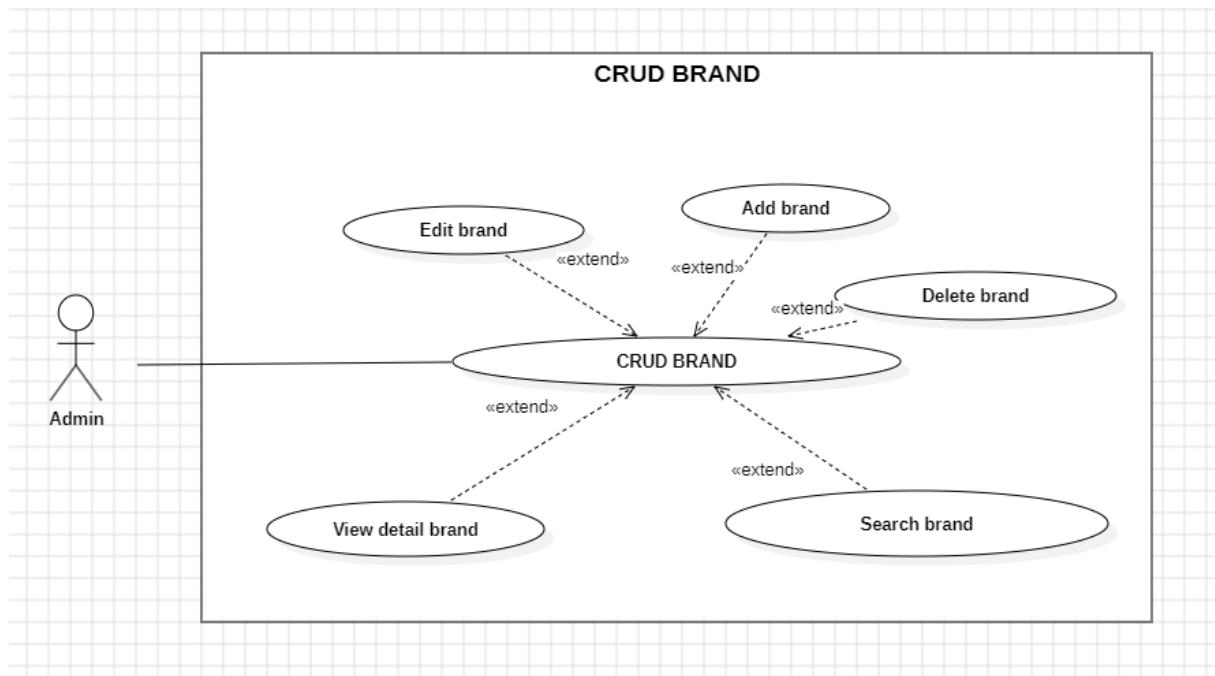

Figure 2.8 Use case banner management

Table 2.6 Scenario Use-case “Banner”

| Use case name    | Banner   |
|------------------|--|
| Description      | Used to manage banner  |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show list of banner  |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Banner” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, edit, delete, search) for the banner.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.8 Brand

*Figure 2.9 Use case brand management*

*Table 2.7 Scenario Use-case “Brand”*

| Use case name    | Brand  |
|------------------|--|
| Description      | Used to manage brand   |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show list of brand   |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Brand” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, edit, search) for the brand.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.9 Category

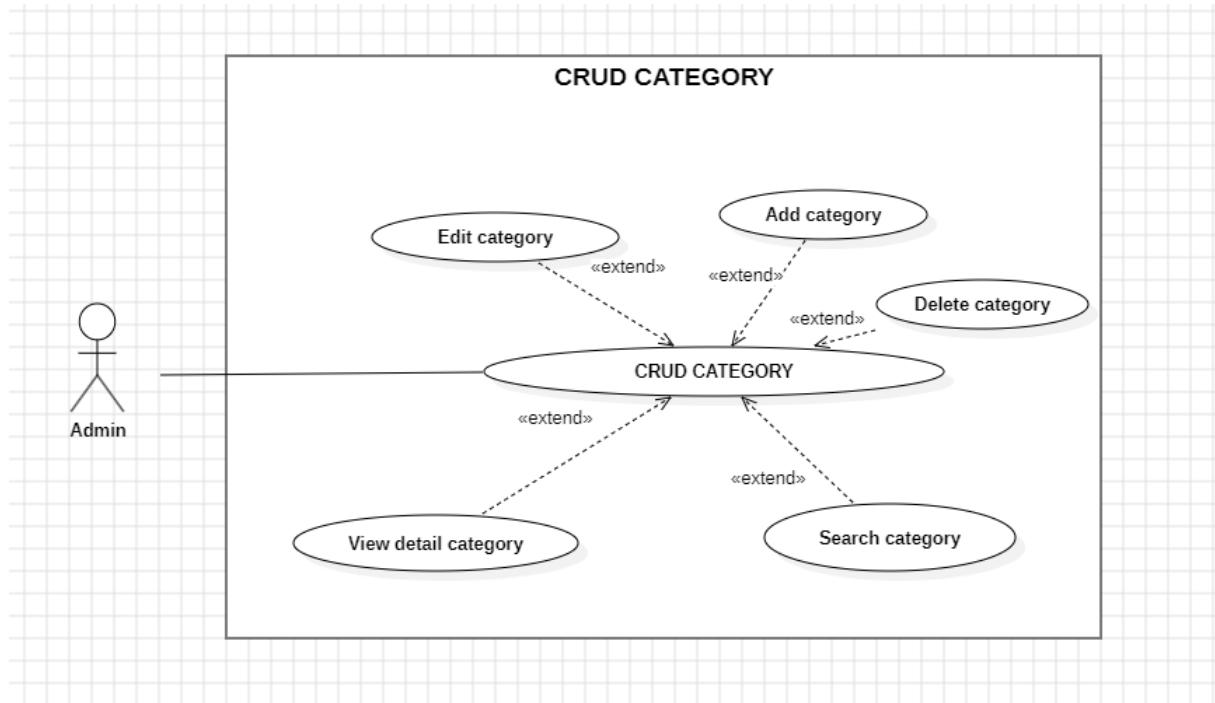

Figure 2.10 Use case category management

Table 2.8 Scenario Use-case “Category”

| Use case name    | Category   |
|------------------|--|
| Description      | Used to manage category  |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show list of category  |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Category” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, edit, delete, search) for the category.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.10 Media

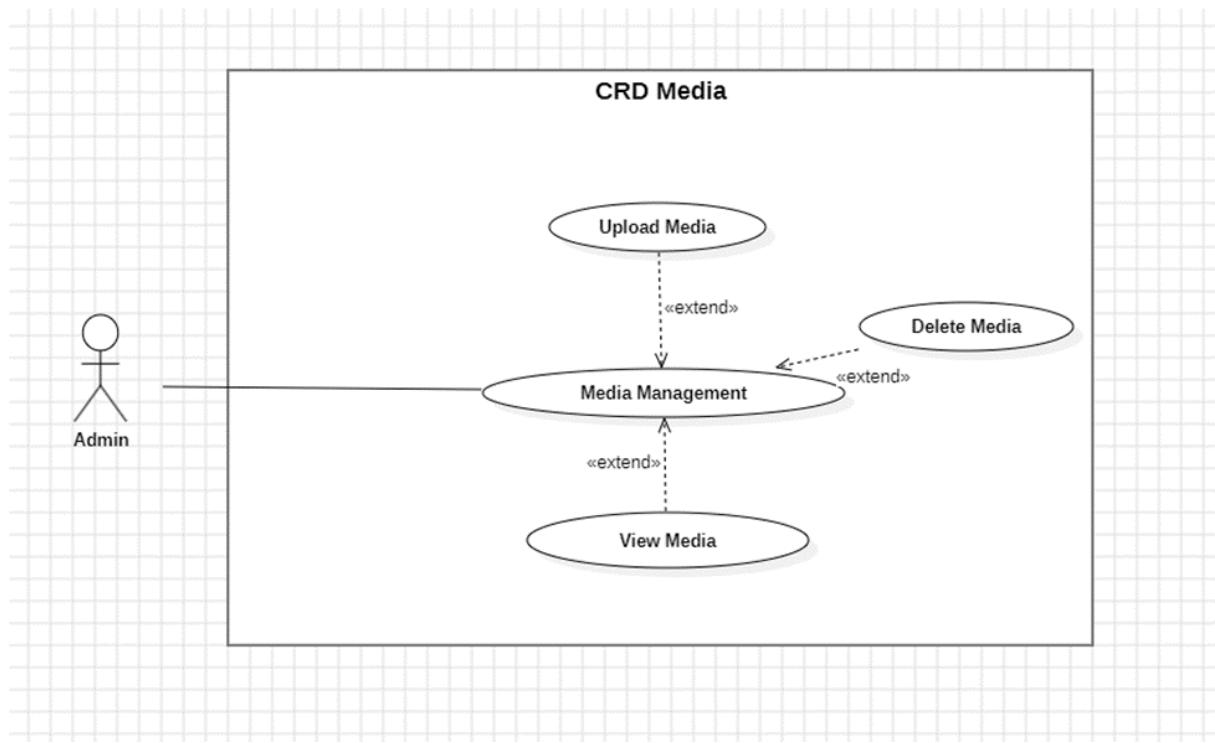

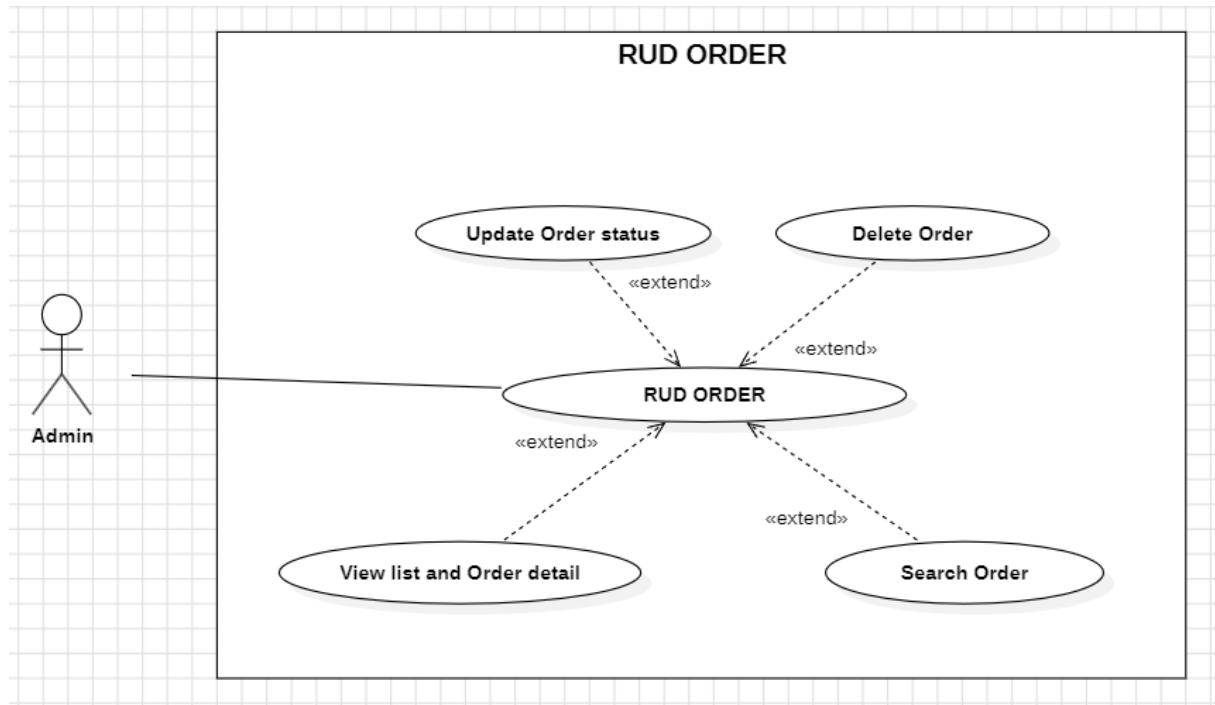

Figure 2.11 Use case media management

Table 2.9 Scenario Use-case “Media”

|                         |  |
|-------------------------|--|
| <b>Use case name</b>    | <b>Media</b>   |
| <b>Description</b>      | Used to manage media   |
| <b>Actors</b>           | Admin  |
| <b>Input</b>            | Actor successfully logged in with admin rights   |
| <b>Output</b>           | Show list of media   |
| <b>Basic flow</b>       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Media” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, delete, search) for the media.</li> <li>3. The system records user uploads if any. -&gt; End of use case</li> </ol> |
| <b>Alternative flow</b> |  |
| <b>Exception flow</b>   | If the newly created information is invalid (incorrect format, empty task name, etc.), the system will display an error message and ask for correction.  |

### 2.3.11 Order

*Figure 2.12 Use case order management*

*Table 2.10 Scenario Use-case “Order”*

|                         |  |
|-------------------------|--|
| <b>Use case name</b>    | Order  |
| <b>Description</b>      | Used to manage order   |
| <b>Actors</b>           | Admin  |
| <b>Input</b>            | Actor successfully logged in with admin rights   |
| <b>Output</b>           | Show list of order   |
| <b>Basic flow</b>       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Order” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, edit, delete, search) for the order.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| <b>Alternative flow</b> |  |
| <b>Exception flow</b>   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.12 Profile

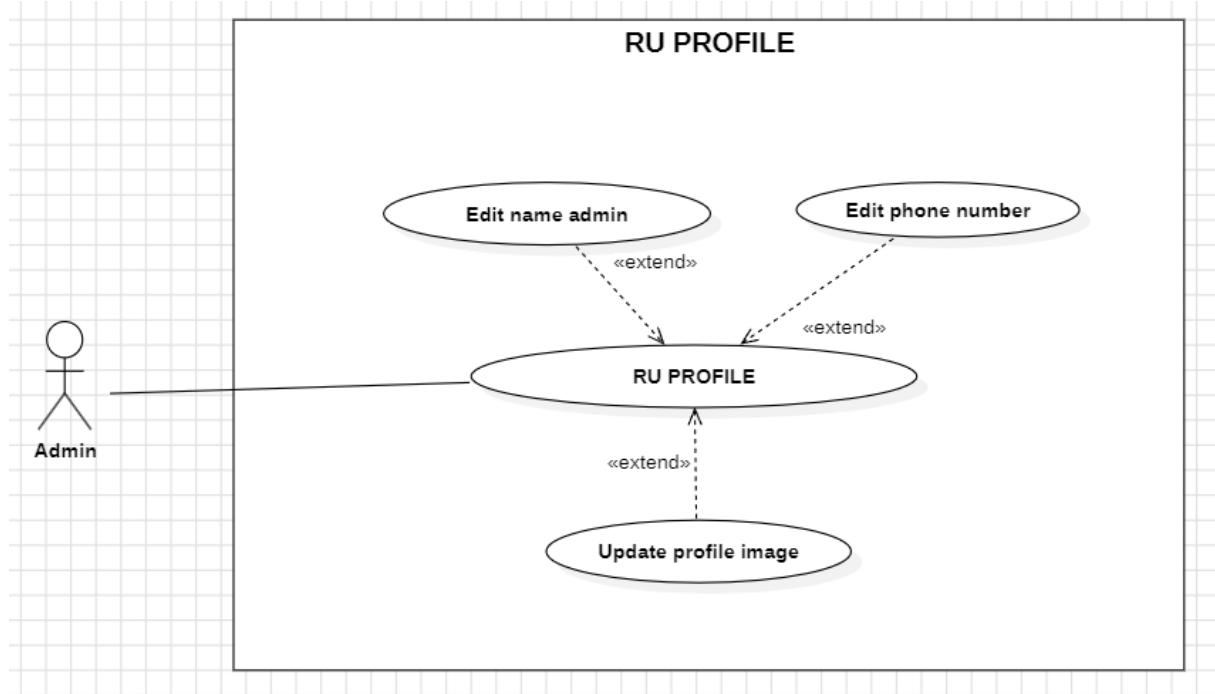

Figure 2.13 Use case profile management

Table 2.11 Scenario Use-case “Profile”

| Use case name    | Profile  |
|------------------|--|
| Description      | Used to manage profile   |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show profile detail  |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Profile” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, edit) for the profile.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

### 2.3.13 Setting

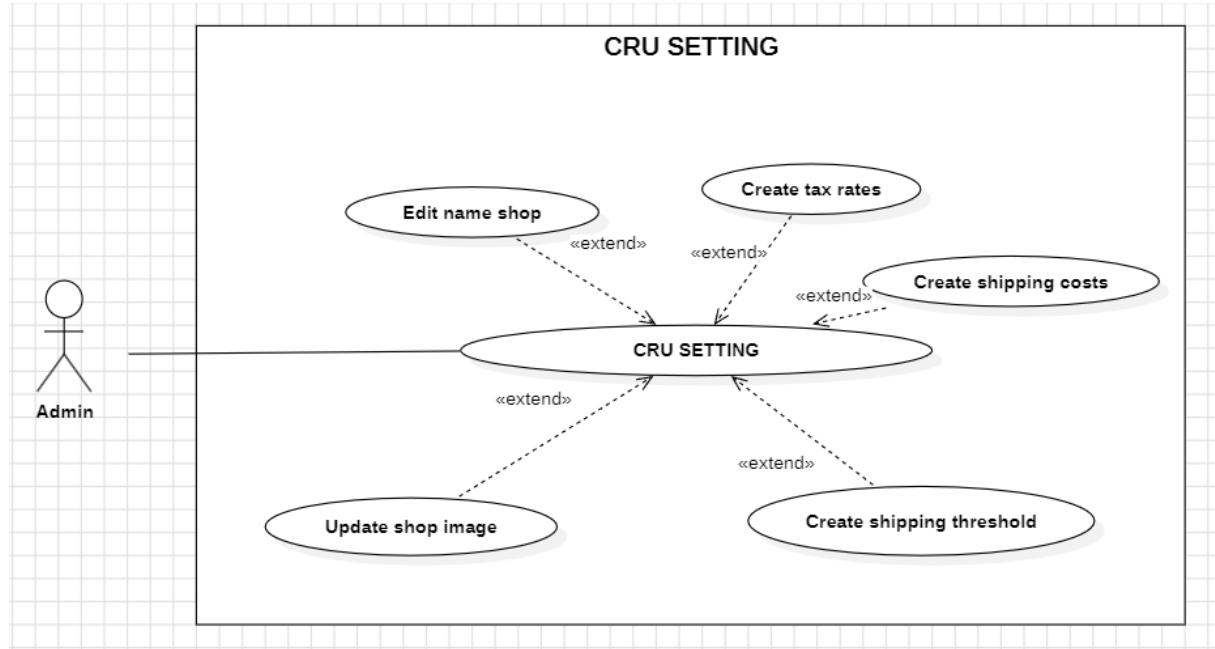

Figure 2.14 Use case setting management

Table 2.12 Scenario Use-case “Setting”

| Use case name    | Setting  |
|------------------|--|
| Description      | Used to manage setting   |
| Actors           | Admin  |
| Input            | Actor successfully logged in with admin rights   |
| Output           | Show setting detail  |
| Basic flow       | <ol style="list-style-type: none"> <li>1. Actor clicks on the “Setting” menu in the side-bar -&gt; Start Use case</li> <li>2. Actor performs the necessary operations (view details, create, edit) for the setting.</li> <li>3. The system records and updates user edits if any. -&gt; End of use case</li> </ol> |
| Alternative flow |  |
| Exception flow   | If the edited information is invalid (incorrect format, empty task name, etc.), the system will display an error message and request re-editing.   |

Table 2.13 “User” database

| Attribute      | Describe                 | Type data           | Note          |
|----------------|--------------------------|---------------------|---------------|
| id             | User unique identifier   | String?             | Optional      |
| firstName      | User first name          | String              |               |
| lastName       | User last name           | String              |               |
| userName       | User username            | String              |               |
| email          | User email address       | String              | Required      |
| phoneNumber    | User phone number        | String              |               |
| profilePicture | User profile picture URL | String              |               |
| role           | User role in system      | AppRole             | Default: user |
| createdAt      | Account creation date    | DateTime?           | Optional      |
| updatedAt      | Last update date         | DateTime?           | Optional      |
| orders         | User order history       | List<OrderModel>?   | Optional      |
| addresses      | User saved addresses     | List<AddressModel>? | Optional      |

### 2.8.2 Address

Table 2.14 “Address” database

| Attribute       | Describe                  | Type data | Note          |
|-----------------|---------------------------|-----------|---------------|
| id              | Address unique identifier | String    | Required      |
| name            | Recipient name            | String    | Required      |
| phoneNumber     | Recipient phone number    | String    | Required      |
| street          | Street address            | String    | Required      |
| city            | City name                 | String    | Required      |
| state           | State/Province            | String    | Required      |
| postalCode      | Postal/ZIP code           | String    | Required      |
| country         | Country name              | String    | Required      |
| dateTime        | Address creation date     | DateTime? | Optional      |
| selectedAddress | Is selected address       | bool      | Default: true |

### 2.8.3 CartItem

Table 2.15 “CartItem” database

| Attribute         | Describe                   | Type data            | Note         |
|-------------------|----------------------------|----------------------|--------------|
| productId         | Product identifier         | String               | Required     |
| title             | Product title              | String               | Default: "   |
| price             | Product price              | double               | Default: 0.0 |
| image             | Product image URL          | String?              | Optional     |
| quantity          | Item quantity              | int                  | Required     |
| variationId       | Product variation ID       | String               | Default: "   |
| brandName         | Product brand name         | String?              | Optional     |
| selectedVariation | Selected variation options | Map<String, String>? | Optional     |

### 2.8.4 Order

Table 2.16 “Order” database

| Attribute                    | Describe                          | Type data           | Note                        |
|------------------------------|-----------------------------------|---------------------|-----------------------------|
| id                           | Order unique identifier           | String              | Required                    |
| docId                        | Document ID in Firebase           | String              | Default: "                  |
| userId                       | User identifier                   | String              | Default: "                  |
| status                       | Order status                      | OrderStatus         | Required                    |
| totalAmount                  | Total order amount                | double              | Required                    |
| shippingCost                 | Shipping cost                     | double              | Required                    |
| taxCost                      | Tax amount                        | double              | Required                    |
| orderDate                    | Order creation date               | DateTime            | Required                    |
| paymentMethod                | Payment method used               | String              | Default: 'Cash on Delivery' |
| shippingAddress              | Shipping address                  | AddressModel?       | Optional                    |
| billingAddress               | Billing address                   | AddressModel?       | Optional                    |
| deliveryDate                 | Expected delivery date            | DateTime?           | Optional                    |
| items                        | Order items list                  | List<CartItemModel> | Required                    |
| billingAddressSameAsShipping | Same billing and shipping address | bool                | Default: true               |

### 2.8.5 Banner

Table 2.17 “Banner” database

| Attribute    | Describe                 | Type data | Note     |
|--------------|--------------------------|-----------|----------|
| id           | Banner unique identifier | String?   | Optional |
| imageUrl     | Banner image URL         | String    | Required |
| active       | Is banner active         | bool      | Required |
| targetScreen | Target screen navigation | String    | Required |

### 2.8.6

### 2.8.7 Product

Table 2.18 “Product” database

| Attribute         | Describe                    | Type data                     | Note         |
|-------------------|-----------------------------|-------------------------------|--------------|
| id                | Product unique identifier   | String                        | Required     |
| title             | Product title               | String                        | Required     |
| stock             | Available stock quantity    | int                           | Required     |
| price             | Product price               | double                        | Required     |
| thumbnail         | Product thumbnail image     | String                        | Required     |
| productType       | Product type classification | String                        | Required     |
| sku               | Stock Keeping Unit          | String?                       | Optional     |
| salePrice         | Sale/discount price         | double                        | Default: 0.0 |
| soldQuantity      | Total sold quantity         | int                           | Default: 0   |
| isFeatured        | Is featured product         | bool?                         | Optional     |
| brand             | Product brand               | BrandModel?                   | Optional     |
| categoryId        | Category identifier         | String?                       | Optional     |
| description       | Product description         | String?                       | Optional     |
| images            | Product images list         | List<String>?                 | Optional     |
| date              | Product creation date       | DateTime?                     | Optional     |
| productAttributes | Product attributes list     | List<ProductAttribute Model>? | Optional     |
| productVariations | Product variations list     | List<ProductVariation Model>? | Optional     |

### 2.8.8 Category

Table 2.19 “Category” database

| Attribute | Describe                   | Type data | Note     |
|-----------|----------------------------|-----------|----------|
| id        | Category unique identifier | String    | Required |
| name      | Category name              | String    | Required |

|            |                        |           |                |
|------------|------------------------|-----------|----------------|
| image      | Category image URL     | String    | Required       |
| parentId   | Parent category ID     | String    | Default: "     |
| isFeatured | Is featured category   | bool      | Default: false |
| createdAt  | Category creation date | DateTime? | Optional       |
| updatedAt  | Last update date       | DateTime? | Optional       |

### 2.8.9 Brand

Table 2.20 "Brand" database

| Attribute       | Describe                | Type data            | Note           |
|-----------------|-------------------------|----------------------|----------------|
| id              | Brand unique identifier | String               | Required       |
| name            | Brand name              | String               | Required       |
| image           | Brand logo/image URL    | String               | Required       |
| isFeatured      | Is featured brand       | bool                 | Default: false |
| productsCount   | Number of products      | int?                 | Optional       |
| createdAt       | Brand creation date     | DateTime?            | Optional       |
| updatedAt       | Last update date        | DateTime?            | Optional       |
| brandCategories | Brand categories list   | List<CategoryModel>? | Not mapped     |

### 2.8.10 Image

Table 2.21 "Image" database

| Attribute | Describe                | Type data | Note       |
|-----------|-------------------------|-----------|------------|
| id        | Image unique identifier | String    | Default: " |
| url       | Image download URL      | String    | Required   |
| folder    | Storage folder path     | String    | Required   |
| filename  | Image filename          | String    | Required   |

|                     |                     |            |            |
|---------------------|---------------------|------------|------------|
| sizeBytes           | File size in bytes  | int?       | Optional   |
| mediaCategory       | Media category type | String     | Default: " |
| fullPath            | Full storage path   | String?    | Optional   |
| createdAt           | Image creation date | DateTime?  | Optional   |
| updatedAt           | Last update date    | DateTime?  | Optional   |
| contentType         | File MIME type      | String?    | Optional   |
| file                | HTML File object    | File?      | Not mapped |
| isSelected          | Selection state     | RxBool     | Not mapped |
| localImageToDisplay | Local image bytes   | Uint8List? | Not mapped |

### 2.8.11 ProductCategory

Table 2.22 “ProductCategory” database

| Attribute  | Describe                   | Type data | Note       |
|------------|----------------------------|-----------|------------|
| id         | Relation unique identifier | String    | Default: " |
| productId  | Product identifier         | String    | Required   |
| categoryId | Category identifier        | String    | Required   |

### 2.8.12 BrandCategory

Table 2.23 “BrandCategory” database

| Attribute  | Describe                   | Type data | Note     |
|------------|----------------------------|-----------|----------|
| id         | Relation unique identifier | String?   | Optional |
| brandId    | Brand identifier           | String    | Required |
| categoryId | Category identifier        | String    | Required |

## 2.9 Interface design

### 2.9.1 User

#### 2.9.1.1 Onboarding

When the user first installs and opens the application, the onboarding screen will appear. Onboarding consists of 3 screens, after clicking next on the 3rd onboarding screen, they will be redirected to the sign in screen.

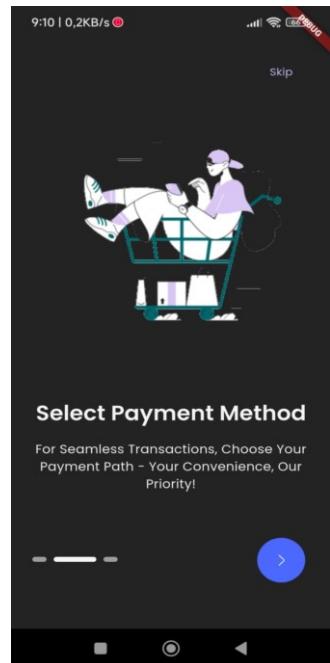

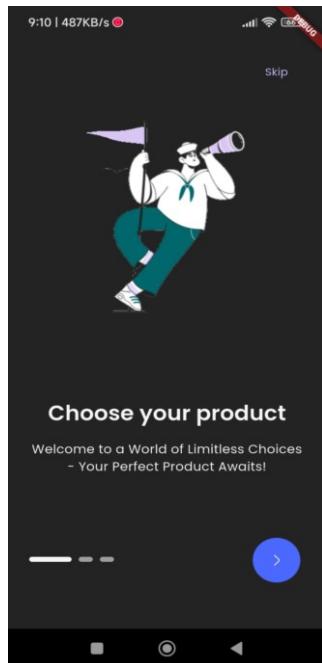

Figure 2.27 “Onboarding 1” interface

Figure 2.28 “Onboarding 2” interface

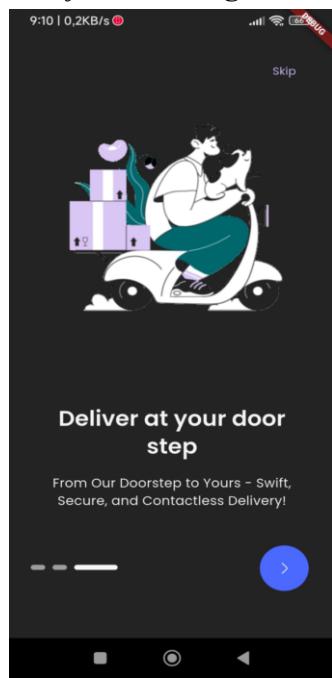

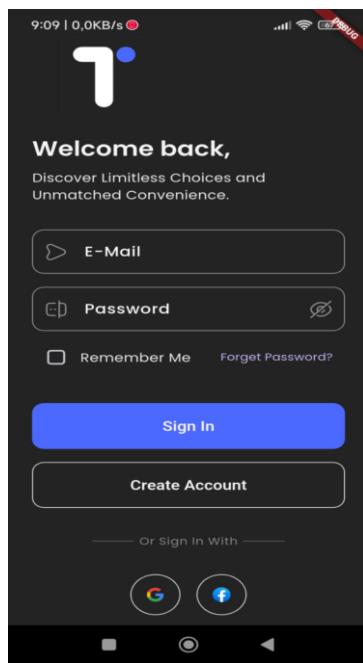

Figure 2.29 “Onboarding 3” interface

### 2.9.1.2 Login

In the login screen, if the user already has an account, they can enter their email and password to log in, or they can log in with their Google or Facebook account. If the user forgets their password, click "Forget password" to get a new password. Click "Remember me" if you want to save your account for future logins. If you don't have an account, click "Create account" to register for an account.

*Figure 2.30 “Sign in” interface*

*Table 2.24 “Sign in” interface*

| <b>Interface</b>         | Sign in  |      |                               |
|--------------------------|--|------|-------------------------------|
| <b>Describe</b>          | The interface allows users to log in to use other functions. |      |                               |
| <b>Access</b>            | User clicks on sign in button                                |      |                               |
| <b>Interface content</b> |  |      |                               |
| Item                     | Type   | Data | Describe                      |
| Email                    | Textbox-String   | N/A  | Where to enter login email    |
| Password                 | Textbox-String   | N/A  | Where to enter password       |
| Remember Me              | Button   | N/A  | Where to remember passwords   |
| Sign in                  | Linked Button  | N/A  | Log in to the system          |
| Forgot Password          | Linked Button  | N/A  | Leads to forgot password page |

| Create account                    | Linked Button   | N/A                     | Leads to registration page                       |
|-----------------------------------|---|-------------------------|--|
| <b>Work</b>                       |   |                         |  |
| Name                              | Describe  | Success                 | Failure  |
| No email entered                  | Do not enter email then press sign in button                        |                         | “Invalid email address” message                  |
| No password entered               | Do not enter password then press sign in button                     |                         | “Password is required” message                   |
| Sign in with account and password | Process login to the system with the entered user name and password | Redirect to home screen | “Something went wrong. Please try again” message |

### 2.9.1.3 Register

In the register screen, the user must enter all information in the correct format (firstname, lastname, username, email, phone number, password). Then must accept the terms of use. Next, click "Create account" to register an account. Or the user can log in directly with a google or facebook account without having to register.

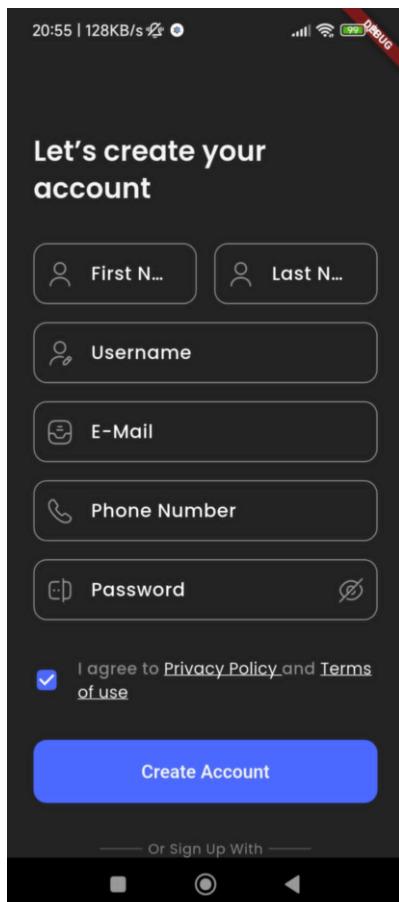

Figure 2.31 “Register 1” interface

Table 2.25 “Sign up” interface

| <b>Interface</b>            | Sign up  |                          |  |
|-----------------------------|--|--------------------------|--|
| <b>Describe</b>             | Interface allows users to sign up for an account       |                          |  |
| <b>Access</b>               | User clicks on create account button                   |                          |  |
| <b>Interface content</b>    |  |                          |  |
| Item                        | Type   | Data                     | Describe   |
| First name                  | Textbox-String   | N/A                      | Where to enter first name                        |
| Last name                   | Textbox-String   | N/A                      | Where to enter last name                         |
| Username                    | Textbox-String   | N/A                      | Where to enter login name                        |
| Email                       | Textbox-String   | N/A                      | Where to enter email                             |
| Password                    | Textbox-String   | N/A                      | Where to enter password                          |
| Phone Number                | Textbox-String   | N/A                      | Where to enter phone number                      |
| Check box                   | Button   | N/A                      | Accept the policy                                |
| Create Account              | Linked Button  | N/A                      | Leads to registration page                       |
| Google sign in              | Linked Button  | N/A                      | Log in with account Google                       |
| <b>Work</b>                 |  |                          |  |
| Name                        | Describe   | Success                  | Failure  |
| No first name entered       | Do not enter first name then press create account      |                          | “First name is required” message                 |
| No last name entered        | Do not enter last name then press create account       |                          | “Last name is required” message                  |
| No username entered         | Do not enter username then press create account        |                          | “Username is required” message                   |
| No email entered            | Do not enter email then press create account           |                          | “Invalid email address” message                  |
| No phone number entered     | Do not enter phone number then press create account    |                          | “Phone number is required” message               |
| No password entered         | Do not enter password then press create account button |                          | “Password is required” message                   |
| No agree policy             | Do not click agree checkbox                            |                          |  |
| Sign up with Google account | Sign in app with Google account                        | Redirect to login screen | “Something went wrong. Please try again” message |

### 2.9.1.4 Forget Password

If you forget your password, user can click "Forget password" in the login screen. Then enter your email, check gmail and reset new password.

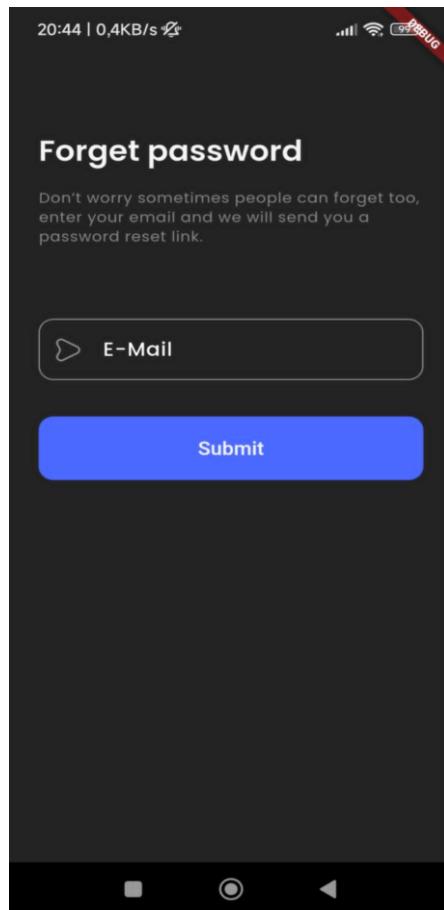

Figure 2.33 “Forget Password” interface

Table 2.26 “Forget” interface

| <b>Interface</b>         | Forget password   |         |                          |
|--------------------------|---|---------|--------------------------|
| <b>Describe</b>          | Allow users to update their passwords                     |         |                          |
| <b>Access</b>            | User clicks on “Forget password” button in sign in screen |         |                          |
| <b>Interface content</b> |   |         |                          |
| Item                     | Type  | Data    | Describe                 |
| Email                    | Textbox-String  | N/A     | Fill in registered email |
| Submit                   | Linked Button   | N/A     | Confirm email            |
| <b>Work</b>              |   |         |                          |
| Name                     | Describe  | Success | Failure                  |

|                      |                          |   |  |
|----------------------|--------------------------|---|--|
| Click Email          | Fill in registered email | Select the email of the account whose password you want to reset. |  |
| Click Favourite icon | Confirm email            | Password reset notification sent to email                         |  |

### 2.9.1.5 Home

In the home interface, user can see products in categories, popular products, advertising banners. User can also click on the shopping cart to see product details

| Click Delete action button | Admin click Delete customer button | Remove customer from the table |  |
|----------------------------|------------------------------------|--------------------------------|--|

### 2.9.2.9 Order

In the order screen, admin can view the list of orders, view details, update status and delete orders.

The screenshot shows the 'Orders' section of the T\_STORE application. The left sidebar has a blue-highlighted 'Orders' button. The main area displays a table of orders with columns: Order ID, Date, Items, Status, Amount, and Action. There are two rows: one for order #27138 (Pending) and one for order #25809 (Cancelled). Each row has a trash icon in the Action column.

| Order ID | Date        | Items   | Status    | Amount | Action |
|----------|-------------|---------|-----------|--------|--------|
| #27138   | 01 Aug 2025 | 1 Items | Pending   | \$126  |        |
| #25809   | 11 Jul 2025 | 2 Items | Cancelled | \$3129 |        |

Figure 2.83 “Order” interface

The screenshot shows the 'Orders' section with order #27138 selected. The left sidebar has 'Orders' selected. The main area shows detailed information for order #27138. A modal window is open over the order details, listing status options: Pending, Processing, Shipped, Delivered, and Cancelled. Other sections visible include 'Customer' (Lai Phan), 'Contact Person' (Lai Phan), 'Shipping Address', and 'Billing Address'.

| <b>Interface</b>           | Orders  |                                   |                     |
|----------------------------|---|-----------------------------------|---------------------|
| <b>Describe</b>            | Show list order and admin can update,view order detail  |                                   |                     |
| <b>Access</b>              | Admin clicks Orders button in sidebar                   |                                   |                     |
| <b>Content</b>             |   |                                   |                     |
| Item                       | Type  | Data                              | Describe            |
| Table order                | Table   | N/A                               | Show all order      |
| Search                     | Textbox-String  | N/A                               | Search order        |
| Update Action Button       | Linked Button   | N/A                               | Update status order |
| Delete Action Button       | Button  | N/A                               | Delete order        |
| <b>Act</b>                 |   |                                   |                     |
| Name                       | Describe  | Success                           | Failure             |
| Fill in the search box     | Enter the word you want to search for in the search box | Suggest order by characters typed |                     |
| Click Update action button | Admin click Update order button                         | Redirect to Update order screen   |                     |
| Click Delete action button | Admin click Delete order button                         | Remove order from the table       |                     |

### 2.9.2.10 Profile

In the profile screen, admin can view profile detail ,select image admin and change information

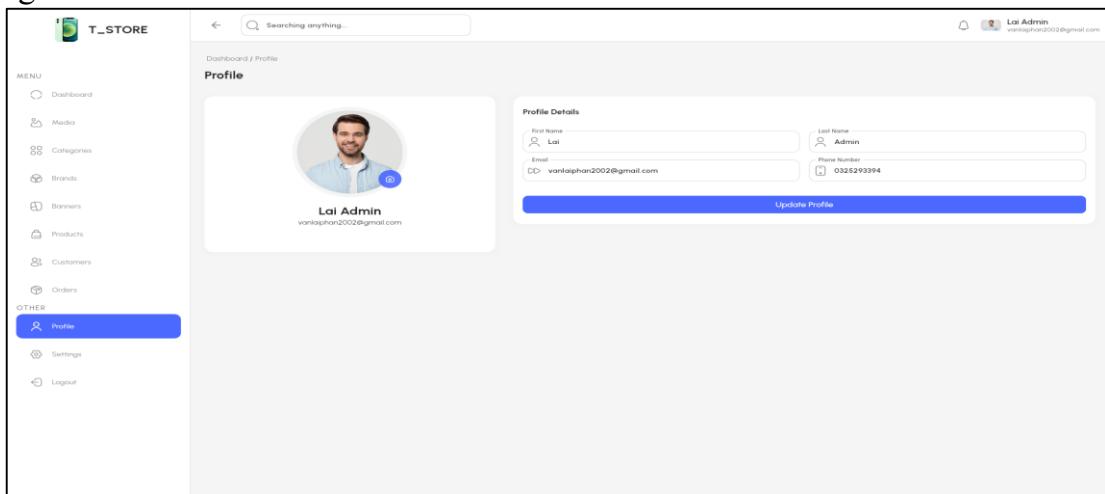

Figure 2.85 “Profile” interface

Table 2.52 “Profile” interface

| <b>Interface</b>          | Profile   |  |                      |
|---------------------------|---|--|----------------------|
| <b>Describe</b>           | Show profile detail                             |  |                      |
| <b>Access</b>             | Admin clicks Profile button in sidebar          |  |                      |
| <b>Content</b>            |   |  |                      |
| Item                      | Type  | Data   | Describe             |
| Update image Button       | Linked Button                                   | N/A  | Update profile image |
| First name                | Textbox-String                                  | N/A  | Update first name    |
| Last name                 | Textbox-String                                  | N/A  | Update last name     |
| Email                     | Textbox-String                                  | N/A  | Admin's email        |
| Phone number              | Textbox-String                                  | N/A  | Update phone number  |
| Update profile            | Button  | N/A  | Update all changes   |
| <b>Act</b>                |   |  |                      |
| Name                      | Describe  | Success  | Failure              |
| Click Update image button | Admin click Update image button                 | Redirect to Media screen to select or upload image |                      |
| Click First name          | Admin click First name to update last name      | Success update first name                          |                      |
| Click Last name           | Admin click Last name to update last name       | Success update last name                           |                      |
| Click Phone number        | Admin click phone number to update phone number | Success update phone number                        |                      |
| Click Update profile      | Admin click Update profile                      | All changes have been updated successfully.        |                      |

### 2.9.2.11 Setting

In the setting screen, admin can choose store avatar, rename, create tax rates, shipping cost, free shipping threshold

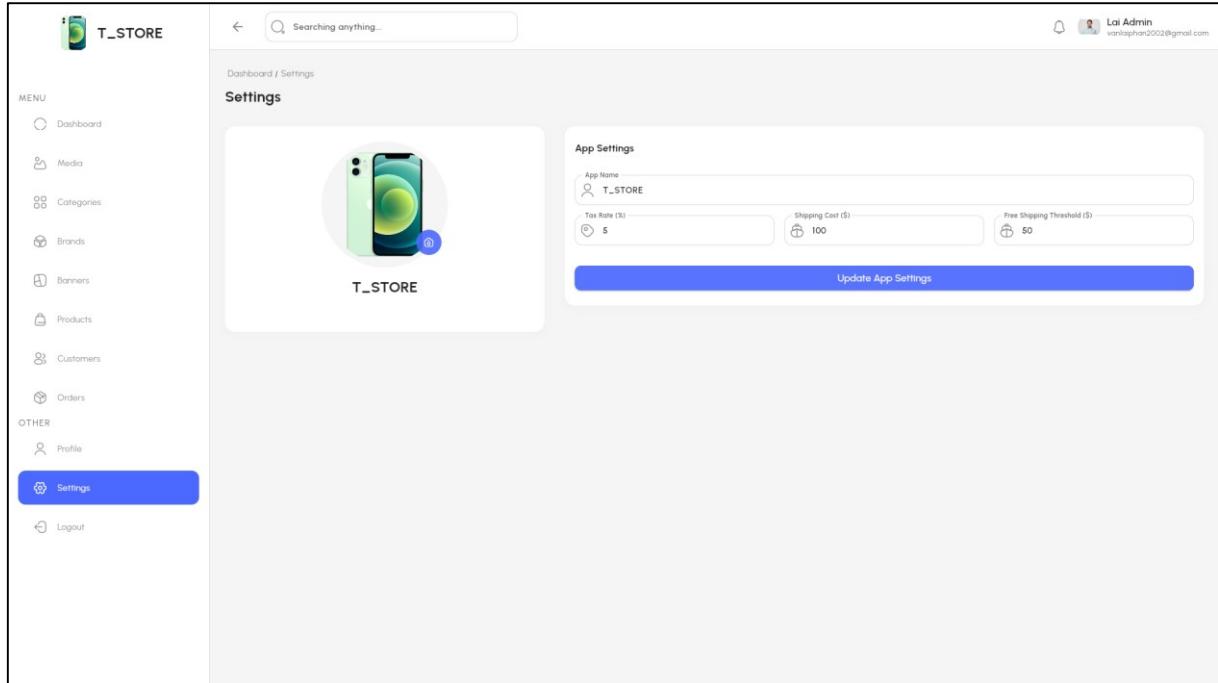

Figure 2.86 “Setting” interface

Table 2.53 “Setting” interface

| Item                    | Type                        | Data                    | Describe                       |
|-------------------------|-----------------------------|-------------------------|--------------------------------|
| Update image Button     | Linked Button               | N/A                     | Update image store             |
| App name                | Textbox-String              | N/A                     | Update app name                |
| Tax rate                | Textbox-String              | N/A                     | Update tax rate                |
| Shipping cost           | Textbox-String              | N/A                     | Update shipping cost           |
| Free shipping threshold | Textbox-String              | N/A                     | Update free shipping threshold |
| Update app settings     | Button                      | N/A                     | Update all changes             |
| <b>Act</b>              |                             |                         |                                |
| Name                    | Describe                    | Success                 | Failure                        |
| Click App name          | Admin click App name button | Success update app name |                                |

|                               |  |   |  |
|-------------------------------|--|---|--|
| Click Tax rate                | Admin click Tax rate to update tax rate                    | Success update tax rate                     |  |
| Click Shipping cost           | Admin click Shipping cost to update shipping cost          | Success update shipping cost                |  |
| Click Free shipping threshold | Admin click Free shipping threshold to update phone number | Success update free shipping threshold      |  |
| Click Update app settings     | Admin click Update app settings                            | All changes have been updated successfully. |  |

# CHAPTER 3. AI-POWERED PRODUCT IMAGE GENERATION AND SMART FEATURES

## 3.1 Product Image Generation System Using AI

In the context of modern e-commerce, visually appealing product images play a crucial role in influencing consumer behavior. However, not all small and medium-sized businesses have the resources to hire professional photographers or designers. To address this challenge, this project integrates an AI-based product image generation system using Stable Diffusion and ComfyUI into the e-commerce application.

### 3.1.1 *ComfyUI*

ComfyUI is a powerful, flexible, and highly modular node-based graphical user interface designed for working with Stable Diffusion models. Unlike traditional interfaces, ComfyUI allows users to build custom image generation pipelines by connecting functional nodes — such as prompt inputs, model loaders, samplers, image processors, and upscalers — in a clear and visually structured manner. This node-based workflow offers unparalleled control and transparency, making it easy to experiment with and fine-tune every aspect of the image generation process.

One of ComfyUI's most notable advantages is its performance efficiency. It leverages GPU acceleration effectively and supports advanced features such as batch processing, latent image manipulation, image-to-image generation, and more. ComfyUI also enables users to load custom models, workflows, and extensions, making it a favorite among artists, researchers, and AI enthusiasts who require both creative freedom and technical depth.

Whether you're a beginner looking to explore AI-generated art or a developer aiming to prototype complex workflows with precision, ComfyUI provides a robust and visually intuitive environment to unlock the full potential of Stable Diffusion.

### 3.1.2 *Image Generation Workflow Design*

This ComfyUI workflow is designed to perform advanced image processing combining text-to-image generation, image manipulation, and multi-stage sampling, utilizing the Flux Kontext model.

### 3.1.2.1 Model Loading and Initialization

The workflow begins by loading three core components:

- UNet model (flux1-dev-kontext) for image generation,
  - CLIP encoders (clip\_1.safetensors, t5xxl\_fp8) for text embedding,
  - VAE model (ae.safetensors) for latent encoding/decoding.
- These are foundational to the prompt-driven image synthesis process.

### 3.1.2.2 Image Input & Preprocessing

Two images are loaded from the local system. One image is processed using background removal (RMBG), while the other is preserved. The images are then combined using ImageStitch nodes to build a customized presentation layout.

### 3.1.2.3 Prompt Handling & Translation

User-written Vietnamese prompts are entered via Text Multiline nodes, then automatically translated to English using GoogleTranslateTextNode. These translated prompts are encoded with CLIP and used for further conditioning.

### 3.1.2.4 Primary and Secondary Sampling Pipelines

- The main prompt is encoded and passed through ReferenceLatent and FluxGuidance, then sampled with KSampler to generate a new latent image.
- A secondary prompt follows the same process in a parallel branch.
- The latent outputs are stored (SaveLatent) and decoded into final images (VAEDecode).

### 3.1.2.5 Output & Visualization

The final images are rendered and saved with SaveImage. Intermediate results are visually stitched together, allowing for a clear presentation format using custom layout configurations.

### 3.1.2.6 Advanced Features

- An optional LoraLoaderModelOnly node is applied to fine-tune the model (e.g., for clothing removal or stylistic transformation).

- A Note node defines the workflow principle: “Remove clothes, then add clothes”, indicating a two-phase transformation logic—useful for virtual try-on, cosplay customization, or AI fashion previews.

## CONCLUSIONS AND SUGGESTIONS

### 1. Conclusions

After the process of research and development, the thesis entitled “Building a Cross-Platform E-commerce Application Using Flutter and Firebase” has achieved the following results:

- Successfully developed an e-commerce application that runs smoothly on both Android and iOS platforms.
- Integrated core functionalities such as user registration/login, product management, shopping cart, and basic order processing.
- The system is implemented using Flutter combined with Firebase, ensuring real-time synchronization, stability, and scalability.
- The application has been thoroughly tested through unit testing, integration testing, and user testing.
- The integration of Artificial Intelligence (AI) enhances user experience by improving product recommendations and data management.

From a technical and academic perspective, this project has helped the team to:

- Strengthen and improve programming skills with Flutter, Firebase, UI/UX design, and software project management.
- Effectively apply system analysis and design models in practice.
- Become familiar with incorporating modern technologies such as AI into real-world applications.

### 2. Suggestions

- In the future, we recommend continuing the development of advanced features such as:
  - + A rating and feedback system for products.
  - + Product recommendations based on user behavior (AI-based).
  - + Integrated payment systems and detailed order tracking.
- Additionally, it is important to further optimize performance and enhance system security to enable the application to be deployed on a larger scale.
